

1. Compiler waits until user thread completes its execution while daemon threads are those background threads which can stop once the application stops or when the main method gets completed.
2. What happens if we make the main thread a daemon thread?
3. Difference between wait() and sleep().
4. Can we use lambda expressions apart from functional interfaces?
5. Create two threads, one printing 'web' and the other printing 'bee' alternatively 5 times.
6. Implement ExecutorService.
7. Ask about the result from interviewer – how to write in a mail?
8. Why was it previously working (contextual debugging question)?
9. JWT token scenario: if one user logs in with a JWT token and another logs in from another tab, what happens with the first user's token?
10. Can we write a full-stack project with Java, or should we try Spring Boot?
11. Why React and not Thymeleaf?
12. What is the mistake in the Runnable implementation example?
13. How StringBuffer and StringBuilder are used?
14. What's wrong in the JDBC code snippet provided?
15. Why do we need to close connections, and what if we don't?
